

Eclipse + GitHub

The instructions below explain how to upload your Eclipse project to your GitHub repository without using HTTP or SSH in Eclipse.

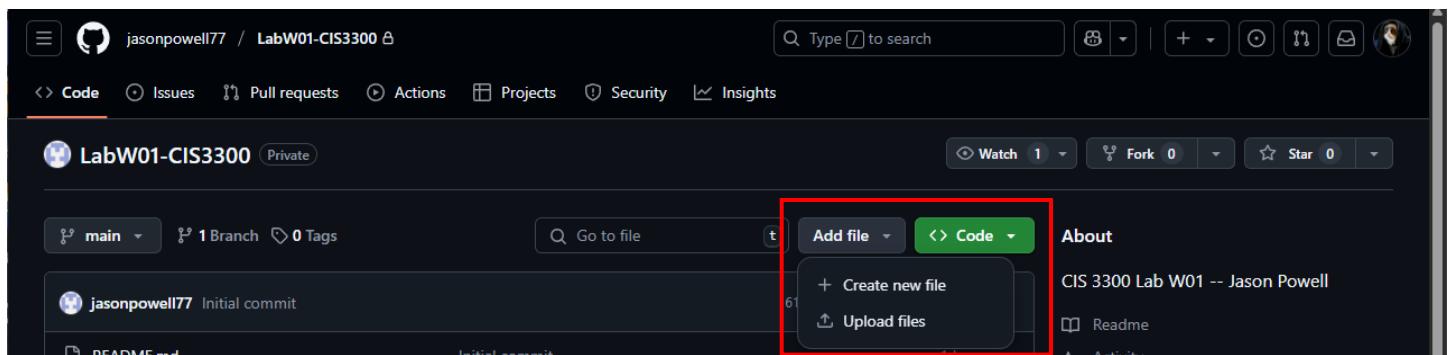

For these instructions, we will use GitHub.com to upload the entire project folder.

Important Notes

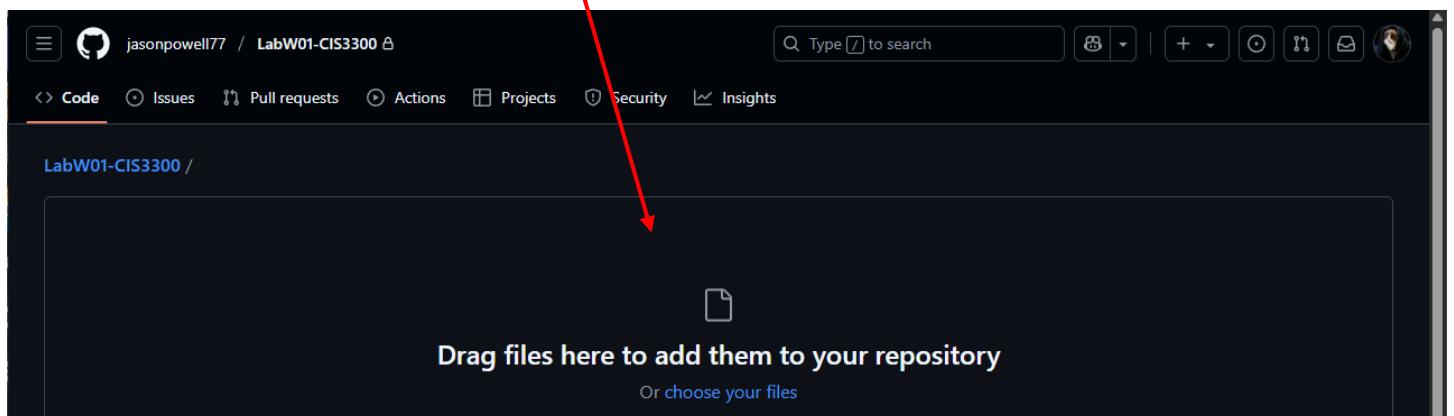

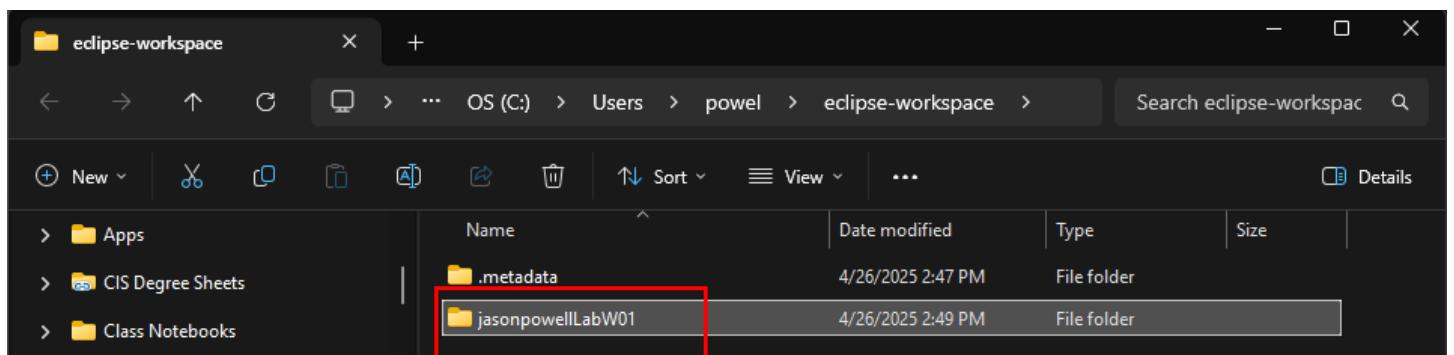

- It is essential to upload the entire Eclipse project folder, not individual source code files.
- Eclipse projects are saved in a workspace (usually named `eclipse-workspace`, but this may vary).
- Your code that you want me to grade must be in the main branch.
- Think of this as a fail-safe if you have issues connecting applications to GitHub.

Note: If you are using other IDEs, you must organize the folders and packages as shown in my Eclipse examples. This is vital. The structure must be set up correctly for me to import it.

1. Use the Add file drop-down menu in your repo to select “Upload files.”

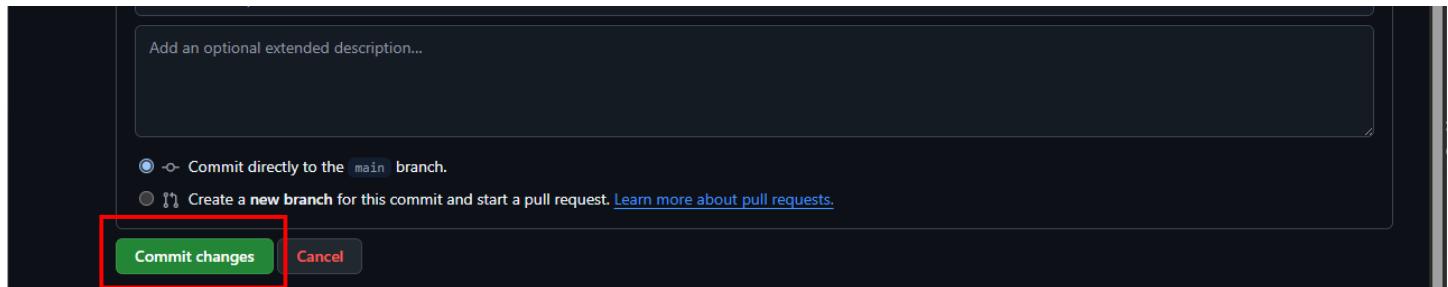

2. Drag and drop your entire project directory into the upload space.

2. After uploading, click “Commit changes” to save the project in your main branch.

Please note that you must commit your projects, especially after making any changes. I do not have access to uncommitted changes.

3. Check to make sure the project was uploaded, and all the files are there.
